

Using the SiteOrigin Editor widget

This article goes over the basics of the SiteOrigin Editor widget. Once logged into WordPress, go to the **Pages** section.

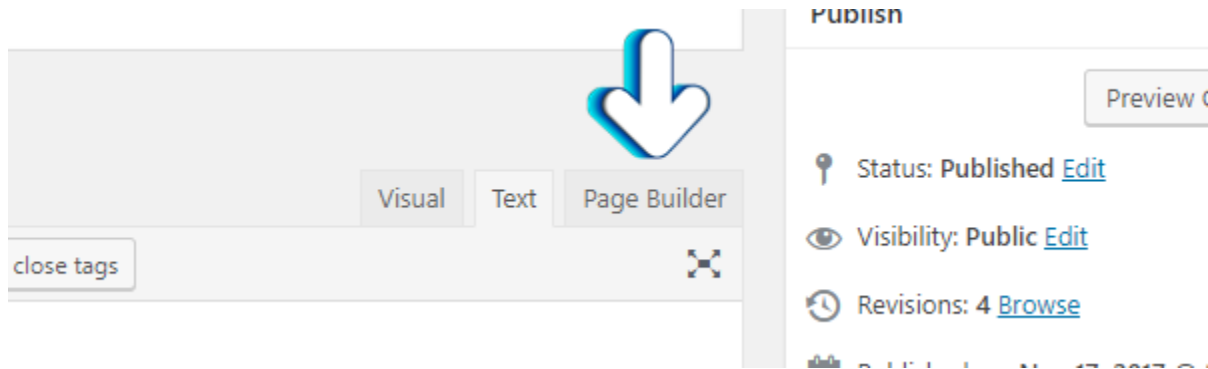

Go to the page you want to edit. For this article I am going to use a news page.

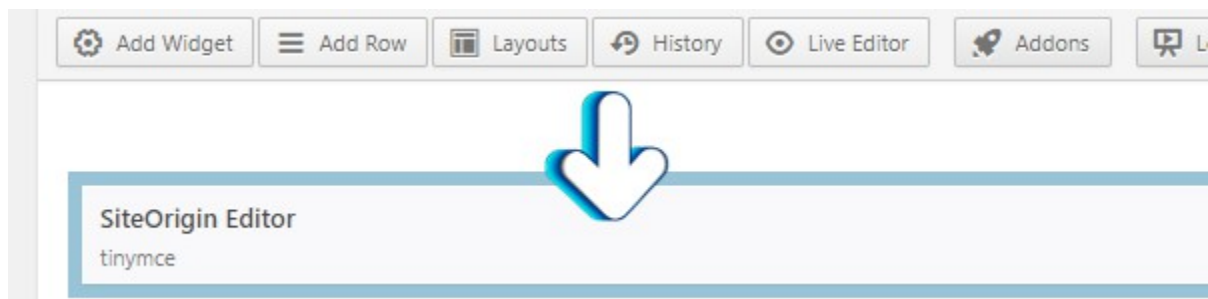

You now should be on the editing page of the page you selected. Make sure you are in the **Page Builder** section. If you see the

following tabs, just click on the **Page Builder** tab. You may get a pop-up asking:
Would you like to copy this editor's existing content to Page Builder?
Just click ok.

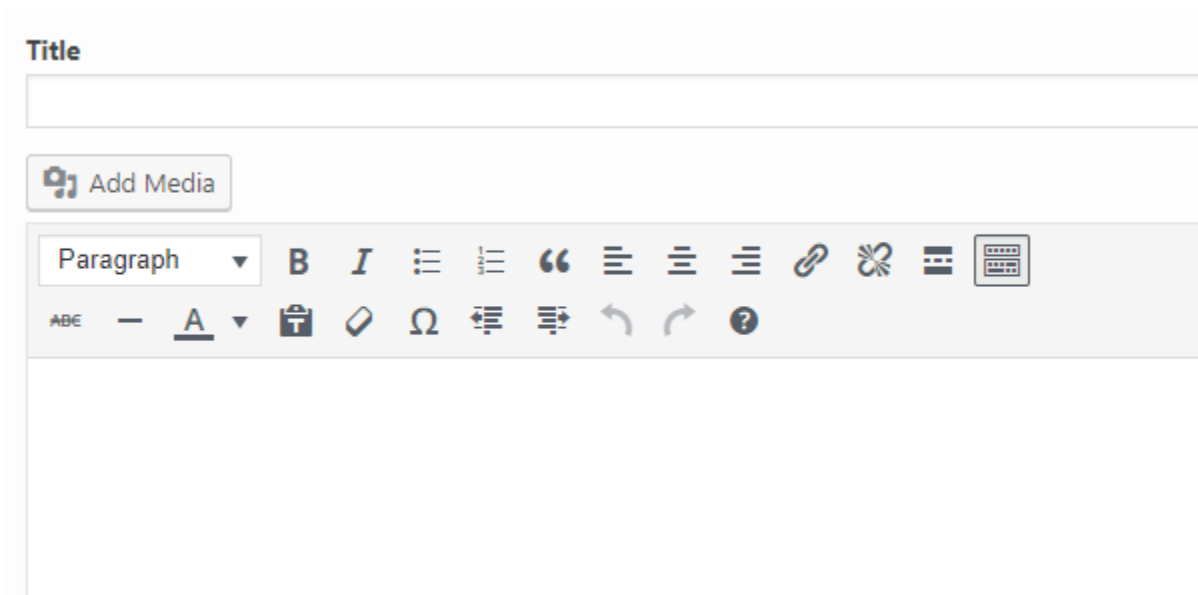

Now click on the **SiteOrigin Editor** widget. If you do not have the widget in already, check out our short article on how to add content using SiteOrigin Page Builder.

<https://www.stackmediadesign.com/index.php/knowledgebase/15/Inserting-content-using-Page-Builder-by-Site-Origin.html>

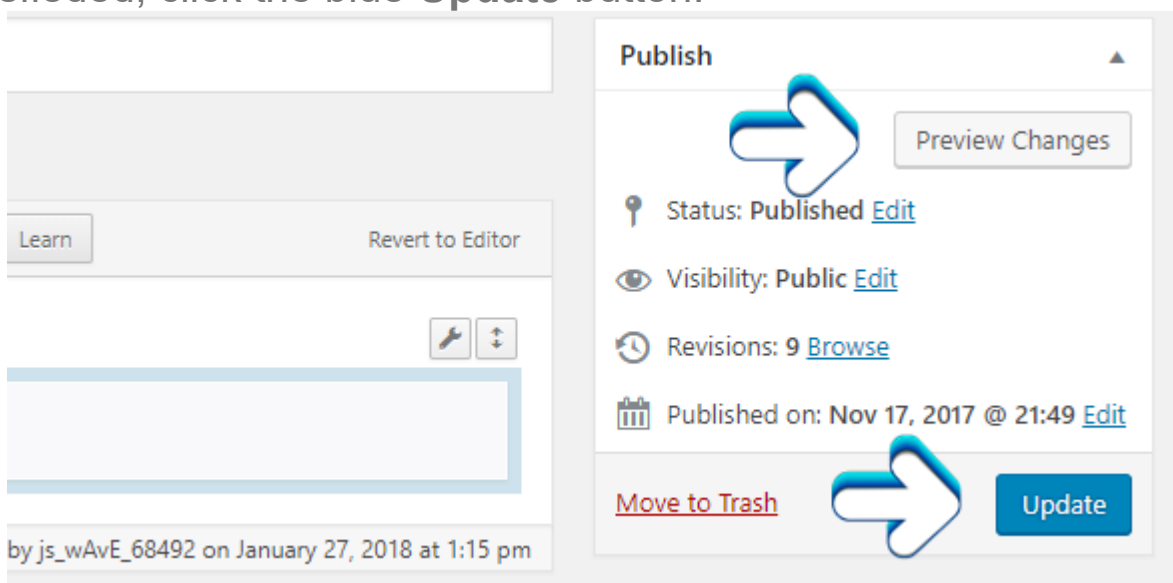

Now you should be at the following screenshot:

The title will be the title for this part of the page and not the entire page. Below that is the **Add Media** button where you can add images and video content. Below that is a basic editor. This has common features that you would find in an editor like Microsoft Word.

Once your all finished click the **Done** button in the bottom right corner. This should bring you back to the main editing area. On the right-hand side you can click the **Preview Changes** button which will open up a new window displaying the page and the edits you added. If you are satisfied, click the blue **Update** button.
